

Spring Web MVC Program

➔ Steps to develop spring web mvc program

1. Create maven project. Choose webapp. Make sure you can run as web project.

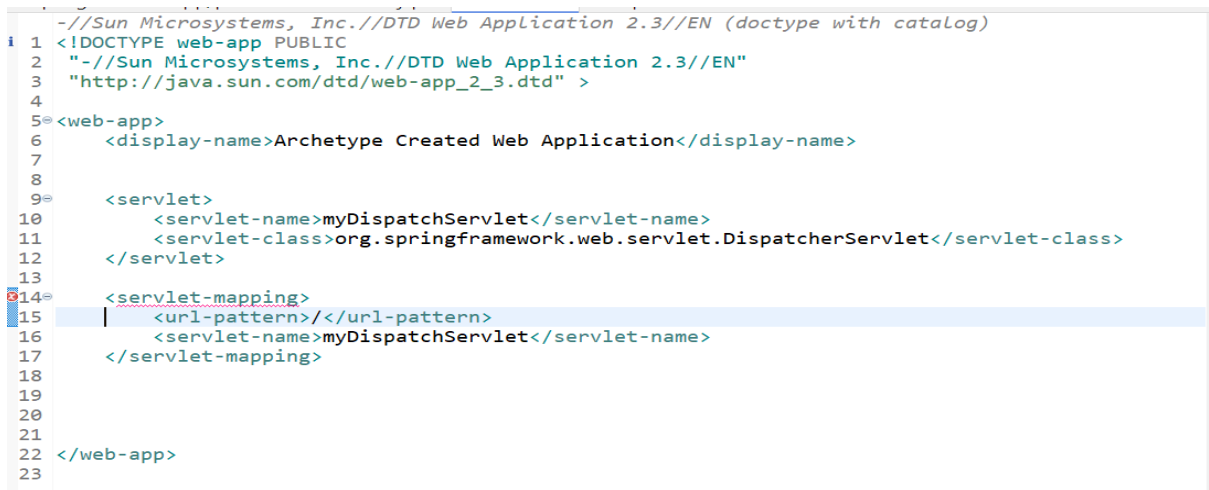

- If you face the error. Remove and recreate index.jsp
- Go to project facets. Choose **apache tomcat 10.1** and **dynamic version 5.0** and **java version 11**
- Now create simple jsp page in **webapp**. Now you wont see error.

2. Provide spring web MVC dependency

- Search "spring web mvc maven"
- Update the pom.xml version 6.16

3. Configure DispatcherServlet class in web.xml

4. Create Spring configuration file (myDispatchServlet-servlet.xml) under WEB-INF and provide the "spring xml file schema". Search the word "the context" and paste it in xml.

5. Configure the handler mapping class.

HandlerMapping -> Main Interface
BeanNameURLHandlerMapping
RequestMappingHandlerMapping (default)
Etc

6. Create controller src/main/java.

- (MyController.java) and add and annotate with @controller annotation.

7. Create handler method in the controller and return the model and view

```
@Controller
public class MyController
{
    @RequestMapping("/myPage")
    public ModelAndView viewPage()
    {
        System.out.println("MyController.viewPage()");
        ModelAndView modelAndView = new ModelAndView();
        modelAndView.setViewName("hello");
        return modelAndView;
    }
}
```

8. Modify Index.jsp and the url.

```
<html>
<body>
    <h2>Welcome to Kodewala</h2>

    <a href="/myPage">Open My Page</a>
</body>
</html>
```

9. Configure view resolver in spring config file

ViewResolver → Interface

InternalResourceViewResolver → Default

10. Create result.jsp in WEB-INF/views which to be returned

11. Update the view and result.

```
<bean
    class="org.springframework.web.servlet.mvc.method.annotation.RequestMappingHandlerMapping" />

<bean
    class="org.springframework.web.servlet.view.InternalResourceViewResolver">

    <property name="prefix" value="/WEB-INF/views/" />
    <property name="suffix" value=".jsp" />
</bean>
</beans>
```

12. Scan the package in spring config file

```
http://www.springframework.org/schema/context http://www.springframework.org/schema/context
<context:component-scan base-package="com.kodewala"/></context:component-scan>
<bean
```

Change deployment assembly. add maven

Src/main/webapp / → java build entry...
